At a GlanceWorks in the backgroundSimple to useSome photos were low-resSome photos were low resSocialFolders makes it easy to create offline copies of your online data. I have photos stored on Facebook. I have spreadsheets stored in Google Docs. I have documents stored in Box. And I have videos stored on YouTube. Which is great–until I want access to these files when I'm offline. I could go to each site and download all of my files until I've amassed an offline collection of my stuff. Or I could just turn to SocialFolders, a service that offers an idea that's so simple–it syncs the content you have on your social sites to your desktop–I have to wonder why someone didn't think of it before. SocialFolders is both an application and a Web service: You download a component to your desktop, which creates a SocialFolders folder that you can access via Windows Explorer. Then you head to socialfolders.me, where you create an account and start connecting your social services. SocialFolders supports Box, Evernote, Facebook, Flickr, Google Docs, Instagram, Photobucket, Picasa, SmugMug, Twitter, and YouTube. (The free version of SocialFolders limits you to three services and 2,000 files; a Premium account, which costs $10 per year, is unlimited.) SocialFolders organizes your Facebook photos into folders that correspond with your album names, and photo titles that correspond to your captions.Once you've connected SocialFolders to your social services, icons for each of them will appear in the SocialFolders folder that's been created on your computer. Subfolders for each of your connected services will automatically be created there, too. You can use SocialFolders's Web interface to determine how much information you'd like access to (all of your Facebook albums, or only a select few, for example), and the content you've chosen will be automatically downloaded to your desktop. You will need to make sure you have the storage to spare, though, as some of these files could takeup plenty of disk space. SocialFolders is not only limited to downloads: It lets you upload files to your social sites, too. You simply create a folder in the SocialFolders directory on your desktop, and its contents will be automatically synced to your account. SocialFolders does more than just create a backup of your files. It also lets you access your friends' photos and files (as long as their privacy settings allow you to do so), and to create an offline copy of these documents, too. I found this a very handy way to grab photos of my nieces and nephews that my siblings share on Facebook. I did notice that some of the photos that SocialFolders downloaded for me looked to be slightly lower res than they appeared when viewed on Facebook, though. The company says that it does not change the resolution of photos when they're downloaded, but that it relies on the API of the social site itself. For example, SocialFolders uses Facebook's default upload API, which can reduce photo resolution. The company does note that most of the photo-sharing sites it supports lets users download photos in full resolution, though. Minor issue with photo resolution aside, I was quite impressed with SocialFolders. It offers a free and easy way to make sure you always have a backup of your precious online data. –Liane Cassavoy {{ result.parntsBbsCtgryNm }} {{ result.bbsCtgryNm }} {{ result.nationAtchVoList[0].extension }} {{ result.nttSj }} {{ result.parntsBbsCtgryNm }} {{ result.bbsCtgryNm }} {{ result.nationAtchVoList[0].extension }} {{ result.nttSj }} Our company TME has over 1200 employees, who provide expert support at each stage of the ordering process. I can't say Carbonite without thinking of Hans Solo frozen within the fictional substance by Jabba the Hutt in The Empire Strikes Back. According to the company's Web site, this is where the name came from–not the family of explosive compounds. Whatever the origins of the name, Carbonite ($55/year) is a pretty darn good online backup service. Initially, I found the way Carbonite integrates itself with the Windows operating system confusing–a quick but mandatory tutorial might have helped. If there was one, I might've missed it as my install crashed at the very end–a non-replicable event on my part as it subsequently proved. Carbonite handily lets you right-click on any folder or file to add/remove it from your backups and also adds a drive to Windows Explorer from which you can restore files (or de-select them from being backed up). If you're backing up a lot of different files and folders, there's also a time-saving search-to-restore function to cut down on the browsing. The logic behind Carbonite's automatic selection of data for backup could perhaps be improved. Unlike most programs that automatically include the Desktop and My Documents (by far the most popular locations for user generated data files), Carbonite only optionally includes these folders. Also, it seemed to back up everything in the Application Data folders–a safe move, but one that adds a lot of data that's useless under any restore scenario that includes re-installing applications. Other than the one-time install crash, Carbonite was as solid as a rock (pun intended) through all my backups and restores. And once I had sussed everything out, I greatly appreciated the Windows Explorer integration–especially the colored dots added to file and folder icons to indicate their backup status (green equals backed up, red means not backed up). You can disable the behavior, however, I wish Carbonite had taken it a step further and put dots (perhaps the company logo's purple) on folders available for restore. After you drill down two levels, the restore window looks confusingly similar to a regular Explorer window. At $55 per year, per PC for unlimited backups, Carbonite is a bit cheaper than the unlimited versions of Fabrik and Mozy. It's easier on the eye and offers better interface integration, though in my book, the logic behind the automatic selection of files needs some rethinking. All in all, if one of the free plans (CrashPlan, Mozy, Fabrik, and SpiderOak all have free plans) won't cover your needs, Carbonite is well worth a look. 0 penilaian0% menganggap dokumen ini bermanfaat (0 suara)937 tayangan1 halaman, aktif Not all malicious and suspicious indicators are displayed.
